Oncall API V3 Mechanical /ERS (Case Creation)

Last Updated:2025-06-20

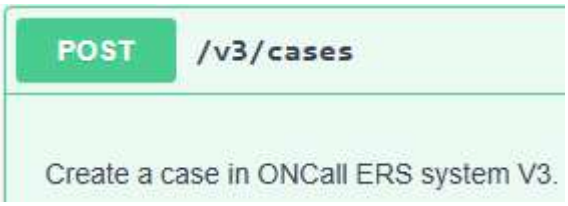
The Unified API provides the ability to create mechanical events and ERS events on the same payload. The API will return a new unifiedID, and that needs to be used to retrieve info about a Unified Case. In the unified response, there are 2 subsections for the ERS case and the mechanical case. Each subsection has its own ID, but it cannot be used to retrieve a mechanical case or ERS case directly.

The entire technical documentation is on the Swagger.json that also has information about the API v1 and v2. Here we can see a summary about the unified API (V3). We will see information about the Create a Case path, authentication, request/response schema payloads, indicating required fields and finally, an example.

NOTE: this Api and Documentation is on in progress status

NOTE: multiple tire product request rows can be sent within the POST call. The type that is sent across in the POST call will indicate whether the product request row will require mechanical related data to complete the record.
NOTE: only a single mechanical request can be sent within the payload

Path:



Authorization: The Api key required will be shared separately.
